Contents:	Factors which are likely to have an effect on the emergence of cancer and cardiovascular diseases, such as education, occupation, physical load, psychosocial working environment, social relations, physical activity, sleep, tobacco and alcohol consumption, health, diseases in the family, use of contraceptive pills etc.
# lines:	28 577
# variables:	291
Sources:	<p>Data have been derived from the Malmö Diet and Cancer Study questionnaire filled in by the individuals. There are three versions of the questionnaire, each with its own corresponding set of database variables. Some of the variables are identical in all three versions (except for their names), some differ only in their details and others are unique for the version in question.</p> <p>The three versions were used during following periods version 1: 1991 03 18 – 1992 03 10 version 2: 1992 03 11 – 1994 09 26 version 3: 1994 09 27 – 1996 09 30</p>
Misc:	The second version is used as a standard. A comparison of the overlapping variables in the three versions are given in the Appendix of the variable description by Peter Wallström. The column "Ver" in the table below shows in which version the question was used. The ht113 Yes/No-variables were corrected in 2022, the new variables were assigned variable names with suffix "_22".
